How To Use

How to use this pack

- Use this after the master Superset interview pack. This file is company-specific: it tells you which project to highlight, what each company is likely to test, and how to answer without sounding scripted.
- Official career pages do not always publish exact campus rounds. Where a fixed pattern is not published, treat the round plan here as a preparation model based on the company page plus common service-company campus hiring patterns.
- Keep answers honest. If a project is ongoing, say it is ongoing. If a feature was handled by another team, say your contribution clearly.

Your 45-second master pitch

- I am Mohammed Shabaz S, an Electronics and Communication Engineering student at BITM with an 8.38 CGPA. My work sits between software and embedded systems. I have built Android-side features for the MITRA assistive-vision project at iHelp Robotics, worked on computer-vision projects like VisionPay and Skin Disease Classification, and built embedded prototypes using ESP32 and STM32. I am strengthening Java, SQL, DSA and software testing, and I am looking for an entry-level software or embedded software role where I can learn fast, write reliable code and contribute to real client or product work.

Your strongest project choices by role

- Software/Application Development: MITRA first, then VisionPay, then Pega training.
- AI/Data/Computer Vision: VisionPay first, then Skin Disease Classification, then MITRA app integration.
- Embedded/IoT: Automotive Body Control Module first, then Smart Wellness Desk Assistant, then MITRA.
- Service-company general role: MITRA first because it combines Android, APIs, testing, user impact and teamwork.

Company Strategy

Accenture

Official signal	Official page mentions application review, interviews, possible online activities/technical assessment, and focus on applied skills, problem solving, logical reasoning and role-specific conversations.
Positioning	Position yourself as a technology learner who can connect software, AI and embedded experience to client problems. Accenture values adaptability, communication and emerging technology exposure.
Highlight	MITRA, VisionPay, Pega National Internship, AEGIS as an architecture-stage idea

Likely preparation rounds:

- Aptitude/logical reasoning and communication
- Technical assessment or coding depending on role
- Technical interview on Java/Python, SQL, projects and SDLC
- HR fit: adaptability, client work, learning attitude

Q: Why Accenture?

A: Accenture works across technology, consulting and operations, so it fits my interest in building practical solutions, not only isolated code. My projects combine Android, AI/ML, embedded systems and user-focused workflows, and I want to grow in a company where I can learn modern technology while solving client problems.

Q: Which project should you discuss first?

A: MITRA. It shows applied Android development, RTSP streaming, voice interaction, OCR/app-side features, testing and collaboration in a real internship environment.

Q: How would your ECE background help at Accenture?

A: ECE gave me hardware, signals and embedded-system fundamentals, while my projects added software, Android, Python and REST API exposure. That combination helps me understand both device-side constraints and application-side workflows.

Q: Tell me about a time you handled ambiguity.

A: In MITRA, requirements were tied to assistive workflows and hardware behavior, so I first clarified the expected user action, then tested small app-side changes, observed failures and improved the workflow step by step.

Q: Are you comfortable with client-facing work?

A: Yes. I may be starting as a fresher, but I understand that client work needs clear communication, ownership and updates. I would clarify requirements, document progress and escalate early if something is blocked.

IBM

Official signal	IBM's official application page lists coding assessment, video assessment and English language assessment depending on role.
Positioning	IBM should hear responsible AI, hybrid cloud awareness, fundamentals and curiosity. Do not overclaim cloud expertise; show readiness to learn enterprise-grade systems.
Highlight	VisionPay, MITRA, AEGIS responsible human-verification workflow

Likely preparation rounds:

- Coding/MCQ assessment
- Video or communication assessment
- English assessment depending on role
- Technical + HR conversation

Q: Why IBM?

A: IBM is strongly associated with enterprise technology, AI and hybrid cloud. My projects are at a student level, but they already involve applied AI, computer vision and practical software integration. I want to learn how these ideas are built reliably at enterprise scale.

Q: Which project best matches IBM?

A: VisionPay, because it uses computer vision, model conversion to TensorFlow Lite, confidence checks and real-time feedback. MITRA is also relevant because it connects assistive technology with app-side integration.

Q: What is responsible AI in your words?

A: Responsible AI means building systems that are useful, explainable enough for the user, tested for failures and not blindly trusted in sensitive decisions. In AEGIS, for example, AI recommends and a human dispatcher verifies.

Q: What would you improve in VisionPay for enterprise quality?

A: I would increase the dataset size, test across lighting and device conditions, add logging, improve deployment packaging, and build a repeatable validation process before calling it production-ready.

Q: How will you handle an unfamiliar IBM technology stack?

A: I would first understand the existing architecture, reproduce a small task locally, read official docs, ask precise questions and then contribute in small tested increments.

Capgemini

Official signal	Capgemini India careers emphasizes AI, technology, people, engineering, client transformation and making technology real.
Positioning	Show engineering discipline, teamwork, documentation and willingness to work across software and embedded technology.
Highlight	Automotive Body Control Module, Smart Wellness Desk Assistant, MITRA

Likely preparation rounds:

- Aptitude and reasoning
- Coding or technical MCQ
- Technical interview with project depth
- HR/communication and team fit

Q: Why Capgemini?

A: Capgemini appeals to me because it combines engineering, technology and client delivery. My background includes embedded systems, Android and AI/ML projects, so I want to grow in a place where technology is applied to real business and engineering problems.

Q: Which project should you present?

A: If the role is engineering or embedded, Automotive Body Control Module. If software, MITRA. If AI/application, VisionPay.

Q: What engineering discipline did you follow in Automotive BCM?

A: I separated the ignition state machine, indicator logic, hazard synchronization, brake handling and OLED feedback. I used non-blocking timing instead of delay-based logic to keep the system responsive.

Q: How do you work in a team?

A: In team projects like Smart Wellness and AEGIS, I keep the scope clear, divide tasks, discuss blockers early and share test observations instead of only saying 'done'.

Q: What makes you different from a pure CSE candidate?

A: I bring software skills along with electronics and embedded thinking. I can reason about sensors, timing, device behavior and application logic together.

Cognizant

Official signal	Cognizant GenC India page says the process can vary by role and includes application, screening, assessment for communication/aptitude/technical skills, interview and result.
Positioning	Show trainability, communication, technical basics, and readiness for a structured early-career program.
Highlight	MITRA, VisionPay, Software Testing certification, Java/SQL/DSA learning

Likely preparation rounds:

- Application and screening
- Communication + aptitude + technical assessment
- Technical interview
- HR/result through campus or registered email

Q: Why Cognizant?

A: Cognizant's GenC program is built for entry-level talent and structured skill development. That matches my current stage: I have hands-on projects, and I want formal exposure to client projects, training and professional engineering practices.

Q: How do you show you are trainable?

A: I have moved across Python, Android, embedded C, Java basics, SQL and testing. In every project I started with fundamentals, built a working version, tested issues and improved from feedback.

Q: What technical areas should you revise most?

A: Java OOP, SQL joins and queries, DSA basics, SDLC, testing types, project explanations and communication questions.

Q: How would you explain MITRA to a non-technical interviewer?

A: MITRA is an assistive-vision system for blind or low-vision users. My work is on the Android side, helping the app handle camera/streaming-related workflows and user interaction features.

Q: Are you okay with training and allocation to different domains?

A: Yes. As a fresher I see training and allocation as part of learning. I would prefer software or embedded-related work, but I am open to starting where the company needs me and building credibility there.

Tech Mahindra

Official signal	Tech Mahindra's careers portal highlights IT/BPS roles and registration with skills and resume; TechM careers emphasizes human experiences, diversity and career growth.
Positioning	Bring out Android, APIs, troubleshooting, telecom/network awareness and client-support readiness. Tech Mahindra may value practical support mindset along with coding basics.
Highlight	MITRA, Android/REST API experience, Automotive BCM, Smart Wellness Desk

Likely preparation rounds:

- Aptitude/English depending on drive
- Technical MCQ or coding
- Technical interview on project and fundamentals
- HR on flexibility, learning and communication

Q: Why Tech Mahindra?

A: Tech Mahindra works strongly in digital technology and IT services, and my projects connect software with real-world systems like Android apps, embedded prototypes and AI-assisted workflows. I want to start in a role where I can learn delivery discipline and contribute reliably.

Q: Why is MITRA relevant?

A: It involves a real user problem, Android implementation, network/stream handling and testing. These are useful in service and product environments

where systems have to work under practical constraints.

Q: Are you comfortable with support or maintenance work?

A: Yes. Support work teaches how real systems fail and how users depend on stability. I would approach it through logs, reproduction steps, root-cause analysis and clear communication.

Q: What is an API?

A: An API is a defined way for two software components to communicate. For example, an Android app can call a backend REST API to send data or receive a response using HTTP methods like GET or POST.

Q: What would you revise for Tech Mahindra?

A: Java/Python basics, SQL, REST APIs, networking basics like IP/ports, Android project details and troubleshooting scenarios.

TCS

Official signal	TCS NQT official pages describe Foundation sections in numerical, verbal and reasoning ability, plus Advanced quantitative/reasoning and coding for Digital/Prime interview eligibility.
Positioning	TCS needs exam readiness plus clean fundamentals. Prepare speed for aptitude and clean code for coding rounds.
Highlight	VisionPay, MITRA, Automotive BCM

Likely preparation rounds:

- TCS NQT Foundation: numerical, verbal, reasoning
- Advanced section: quantitative/reasoning and coding
- Prime/Digital/Ninja interview depending on performance
- Technical + managerial/HR

Q: Why TCS?

A: TCS offers structured entry-level growth, large-scale client projects and strong learning opportunities. I want to build a solid software career, and TCS would give me exposure to professional delivery, training and real-world systems.

Q: What is your NQT strategy?

A: I will revise aptitude daily, practice coding problems in Java, and prepare SQL/OOP/DBMS/OS along with project explanations. Advanced coding matters if I target Digital or Prime.

Q: Which language for coding?

A: Java, because I am strengthening DSA in Java and it is widely used in service-company interviews.

Q: How would you explain polymorphism?

A: Polymorphism means one interface can have multiple implementations. In Java, method overriding lets a child class provide its own behavior for a parent-class method.

Q: What is normalization?

A: Normalization organizes database tables to reduce redundancy and update anomalies. Common forms include 1NF for atomic values, 2NF for removing partial dependency and 3NF for removing transitive dependency.

Infosys

Official signal	Infosys careers pages emphasize graduates, real projects, AI-driven skills, training and continuous learning.
Positioning	Show learning discipline, problem solving, training readiness and Java/SQL/DSA preparation.
Highlight	MITRA, VisionPay, Java/DSA/SQL certifications, Pega training

Likely preparation rounds:

- Aptitude and reasoning depending on drive
- Programming/problem solving
- Technical interview
- HR fit and learning attitude

Q: Why Infosys?

A: Infosys is known for training and giving graduates a structured start on real projects. I am looking for exactly that: a place where I can strengthen fundamentals, work with mentors and contribute to software projects.

Q: What will you do if assigned to a technology you do not know?

A: I will build the basics first, understand project standards, ask focused questions and deliver small tested tasks. I have already moved from ECE subjects into Android, Python, Java basics and embedded software this way.

Q: What is the difference between array and linked list?

A: An array stores elements in contiguous memory and supports fast indexing. A linked list stores nodes connected by references, so insertion/deletion can be easier but random access is slower.

Q: Explain exception handling in Java.

A: Exception handling lets us handle runtime errors using try, catch, finally and throw/throws. It prevents abrupt program termination and allows controlled recovery or logging.

Q: What should you revise for Infosys?

A: Aptitude, pseudocode, Java OOP, arrays/strings, SQL basics, DBMS, SDLC and project stories.

Wipro

Official signal	Wipro early careers mentions early exposure to global client projects, cutting-edge technologies, learning, certification and higher-education opportunities in early-career programs.
Positioning	Show readiness for client projects, certifications, learning speed and communication.
Highlight	MITRA, Software Testing, Java/SQL, VisionPay

Likely preparation rounds:

- Aptitude and verbal
- Coding or technical MCQ
- Technical interview
- HR/communication

Q: Why Wipro?

A: Wipro's early-career focus on learning, certification and client projects matches my plan. I have hands-on project exposure and I am completing Java, SQL, DSA and testing certifications to become stronger for software roles.

Q: What is software testing?

A: Software testing checks whether software behaves as expected and helps find defects before users face them. It includes unit testing, integration testing, system testing, regression testing and acceptance testing.

Q: What is regression testing?

A: Regression testing checks that new changes have not broken existing working features.

Q: How do you handle feedback?

A: I listen first, understand the exact gap, make the correction and verify the result. I used this approach while improving my resume and Superset profile too.

Q: What should you revise for Wipro?

A: Java, SQL, testing basics, SDLC, communication and one strong project story.

HCLTech

Official signal	HCLTech campus hiring page describes Graduate Engineer Trainee opportunities for engineering graduates, hands-on latest technologies, mentoring, cross-functional teams and solving business problems. Its India careers page mentions application screening, technical interview and HR discussion.
Positioning	Show engineering graduate readiness, hands-on technology, cross-functional collaboration and problem-solving mindset.
Highlight	Automotive BCM, Smart Wellness Desk, MITRA, VisionPay

Likely preparation rounds:

- Resume/application screening
- Technical interview with discipline/project questions
- Possible puzzles/problem solving
- HR discussion on goals, strengths and passion

Q: Why HCLTech?

A: HCLTech's campus roles focus on engineering graduates, mentoring, latest technologies and cross-functional problem solving. My profile has both embedded and software projects, so I can fit into engineering or software delivery teams and continue growing.

Q: Why Graduate Engineer Trainee?

A: It gives me a structured start, mentoring and exposure to real projects. As an ECE student with software and embedded projects, I want to use the

trainee period to become strong in professional engineering practices.

Q: Tell me about Smart Wellness Desk.

A: It was a team project using STM32 Nucleo-L476RG. I contributed to sensor interfacing, wiring, testing and debugging. The system used presence and temperature sensing, OLED feedback and alerts to encourage healthier desk habits.

Q: What is an interrupt?

A: An interrupt is a signal that temporarily pauses normal program flow so the processor can handle an urgent event, then return to the previous task.

Q: What should you revise for HCLTech?

A: C/Embedded C, microcontroller basics, Java/OOP, SQL, projects, puzzles and HR questions about growth and flexibility.

Technical Q&A**Q: Java: What are OOP pillars?**

A: Encapsulation, inheritance, polymorphism and abstraction. Use a short example: a Vehicle base type, Car overriding behavior, private fields accessed through methods, and interfaces hiding implementation details.

Q: Java: abstract class vs interface?

A: An abstract class can have state and partially implemented behavior. An interface defines a contract; modern Java can also have default/static methods, but it is mainly used for capability-based design.

Q: Java: == vs equals?

A: == compares references for objects; equals compares logical content if implemented. For strings, use equals for value comparison.

Q: Java: final keyword?

A: final variable cannot be reassigned, final method cannot be overridden, final class cannot be inherited.

Q: DSA: How do you choose data structure?

A: Start with operations: search, insert, delete, ordering and memory. Array for indexing, hash map for key lookup, stack/queue for order constraints, tree/heap for hierarchy or priority.

Q: DSA: Time complexity of binary search?

A: $O(\log n)$, but it requires sorted data.

Q: DSA: Stack use case?

A: Function call stack, undo operations, expression evaluation, valid parentheses.

Q: SQL: JOIN types?

A: INNER returns matching rows, LEFT returns all left rows with matches if present, RIGHT returns all right rows, FULL returns all rows from both sides where supported.

Q: SQL: WHERE vs HAVING?

A: WHERE filters rows before grouping; HAVING filters groups after GROUP BY.

Q: SQL: primary key vs foreign key?

A: Primary key uniquely identifies a row. Foreign key references a primary/unique key in another table to maintain relationship integrity.

Q: Testing: unit vs integration testing?

A: Unit testing checks a small function/class alone. Integration testing checks whether multiple modules work together correctly.

Q: Testing: severity vs priority?

A: Severity is technical/business impact of a defect. Priority is how soon it should be fixed.

Q: Testing: smoke vs sanity testing?

A: Smoke checks basic stability after a build. Sanity checks a focused change area after a small fix.

Q: SDLC: Agile vs waterfall?

A: Waterfall is sequential; Agile is iterative with feedback in short cycles.

Q: REST: GET vs POST?

A: GET retrieves data and should be safe/idempotent. POST submits data and may create/change resources.

Q: Git: merge vs rebase?

A: Merge preserves branch history with a merge commit. Rebase rewrites commits onto a new base for linear history.

Q: Android: Activity lifecycle?

A: Core callbacks include onCreate, onStart, onResume, onPause, onStop and onDestroy. Mention saving state and releasing resources.

Q: Android: Why avoid work on main thread?

A: The main thread handles UI. Long work there freezes the app and can cause ANR; use background threads/coroutines.

Q: AI/ML: training vs inference?

A: Training learns model parameters from data. Inference uses the trained model to make predictions on new input.

Q: AI/ML: accuracy vs precision?

A: Accuracy is overall correct predictions. Precision measures how many predicted positives were actually positive.

Q: Computer vision: why preprocessing?

A: It improves consistency by resizing, normalizing, reducing noise or converting color spaces before model input.

Q: Embedded: polling vs interrupt?

A: Polling repeatedly checks a condition. Interrupts react when an event occurs, improving responsiveness.

Q: Embedded: why non-blocking millis logic?

A: It lets multiple tasks continue without freezing the loop, unlike delay-based code.

Q: Embedded: debouncing?

A: Mechanical switches can produce noisy transitions; debouncing filters those transitions in hardware or software.

Project Defense Q&A

Q: MITRA: What exactly did you do?

A: I worked on Android app-side features and integration/testing areas such as RTSP stream handling, phone-camera fallback, navigation-related workflow, TTS/voice interaction support, OCR/app controls and background behavior. I do not claim backend model training for MITRA.

Q: MITRA: Why Android for assistive vision?

A: Android gives camera/media, speech, connectivity and accessibility APIs in one portable device. It is practical for user interaction and field testing.

Q: VisionPay: Why MobileNetV2/TFLite?

A: MobileNetV2 is lightweight and suitable for mobile/edge inference. TFLite makes deployment easier on constrained devices compared to a heavy desktop model.

Q: VisionPay: Why not YOLO?

A: The current project is denomination classification, not full object detection. YOLO would help for multi-note detection or localization, but classification was simpler and enough for the current scope.

Q: VisionPay: What prevents false announcements?

A: Confidence checks, margin checks, background class handling and smoothing/majority logic before speaking the result.

Q: Automotive BCM: Why ESP32?

A: ESP32 is inexpensive, fast enough for control logic, has many GPIOs and is easy to prototype with Arduino-style tooling.

Q: Automotive BCM: What is the state machine?

A: Ignition states such as OFF, ACC and ON define allowed vehicle-control behavior. It avoids random behavior by making transitions explicit.

Q: Smart Wellness: What was your contribution?

A: It was a 3-member/team workshop project. I handled sensor interfacing, wiring, testing/debugging and helped validate OLED/buzzer feedback behavior.

Q: Skin Disease: What should you avoid claiming?

A: Do not call it a medical diagnostic product. Say it was an internship learning project involving image classification workflow, training/evaluation and application/UI work.

Q: AEGIS: Is it completed?

A: No. It is an architecture/design-stage team project. I can explain the idea, workflow, human dispatcher verification and planned AI recommendation flow, but I should not claim completed implementation.

Q: Pega: What did you learn?

A: Application-development workflow, capstone planning, user stories, Kanban tracking, self-paced learning and mentor-supported sessions.

HR And Behavioral

Q: Tell me about yourself for service companies.

A: I am an ECE student with hands-on software and embedded projects. My strongest work is around Android-side assistive technology, computer vision and embedded control. I am strengthening Java, SQL, DSA and software testing, and I am looking for a role where I can learn in a structured team and contribute consistently.

Q: Why should we hire you?

A: I bring a mix of software and embedded thinking, real project exposure, and a learning mindset. I may be a fresher, but I have worked on projects that required debugging, testing, teamwork and adapting to new tools.

Q: What is your weakness?

A: Earlier I used to spend too much time perfecting one part before showing progress. I am improving by breaking work into smaller checkpoints and asking for feedback earlier.

Q: Are you willing to relocate?

A: Yes, if the role and business requirement need it. I would plan the transition responsibly.

Q: Are you comfortable with shifts?

A: Yes, if the project requires it. I would manage my schedule and maintain consistency.

Q: Why ECE to IT?

A: ECE gave me problem-solving, circuits, embedded and signal basics. Through projects I became interested in software because it lets me turn those ideas into usable systems. I see IT as a natural extension, not a switch without preparation.

Q: What salary do you expect?

A: As a fresher, my priority is the role, learning and long-term growth. I am comfortable with the company standard for the position.

Q: What if you are rejected?

A: I will review the gaps, improve my fundamentals and continue applying. I see interviews as feedback as well as opportunity.

24-Hour Drill

Accenture

- Explain one client problem your project solves.
- Give a 30-second example of using technology responsibly.
- Practice one case-style answer: how would you digitize a manual process?

IBM

- Explain AI vs ML vs deep learning.
- Prepare one responsible-AI answer from AEGIS or VisionPay.
- Revise Java OOP and SQL joins.

Capgemini

- Explain Automotive BCM architecture clearly.
- Prepare teamwork examples from Smart Wellness and Skin Disease.
- Revise SDLC and testing.

Cognizant

- Revise communication answers and GenC-style trainability.
- Prepare Java/SQL/DSA basics.
- Explain MITRA without technical jargon.

Tech Mahindra

- Revise REST APIs, Android basics and troubleshooting.
- Prepare shift/support answer.
- Revise networking basics: IP, port, client-server.

TCS

- Practice NQT aptitude daily.
- Solve Java arrays/strings coding problems.
- Revise DBMS, OS and OOP definitions.

Infosys

- Practice pseudocode and Java basics.
- Prepare training/readiness answers.
- Revise SQL and SDLC.

Wipro

- Prepare testing basics.
- Practice communication and project storytelling.
- Revise Java, SQL and one coding problem daily.

HCLTech

- Revise embedded basics and C.
- Prepare Graduate Engineer Trainee answer.
- Practice puzzles and project design questions.
